TECHCOMMAND OS

PARTNER DEMONSTRATION

A clearer way to run every service job together

For enterprise mobility, biomedical, and field-service partners

Purpose

This document demonstrates how TechFlex can receive, price, dispatch, document, invoice, and reconcile partner work inside TechCommand OS. All companies, people, assets, work orders, invoices, prices, and results shown are fictional.

No patient names or PHI are used. Work is identified by partner work-order number.

1. Shared operating model

• Partner users submit requests, approve quotes, message TechFlex, and retrieve records in one account-scoped workspace.

• TechFlex validates contract rules, protects the 40% margin floor, schedules qualified technicians, and manages exceptions.

• Technicians complete guided, evidence-based workflows.

• Approved completion creates the service report, invoice, payout record, and integration events together.

2. Fictional partner workspace

• Demo account: Northstar Mobility Partners

• Visible only to assigned partner users and allowed locations

• Internal cost, margin, technician pay, employee files, and other accounts are excluded

Illustrative dashboard

Metric	Demo value
Open requests	6
Quotes awaiting approval	2
Scheduled this week	9
Open invoices	$4,860

3. Request-to-dispatch controls

Gate	Required outcome	If incomplete
Submit	Work-order number, location, unit, job type	Held in intake
Validate	Contract, contact, data completeness	Administrator task
Quote	Account rate card and complete direct-cost basis	Quote blocked
Approve	Named partner authorization	No dispatch
Dispatch	Qualified technician, schedule, route, margin recheck	Assignment held

The system does not convert an incomplete email into a live job or let an underfunded assignment quietly reach the technician.

4. Guided field execution

Fictional work order: **NSM-10482-2**

• Verify manufacturer, model, and serial.

• Capture category-specific before, serial, condition, and after photos.

• Complete job-specific diagnostics and safety checks.

• Record labor, parts, resolution, exceptions, and signature.

• Submit to administrative QA.

Training Mode adds explanations, prompts, and knowledge checks. Graduation removes coaching but never removes evidence, safety, or documentation gates.

5. Asset record

Field	Fictional value
Equipment	Powered wheelchair
Manufacturer	Apex Mobility (demo)
Model / serial	AX-500 / DEMO-88214
Location	Northstar - Columbus
Linked history	Requests, photos, diagnostics, parts, reports, invoices

6. Quality assurance

• Submission cannot advance while required evidence is missing.

• QA approves, returns, or requests a named correction.

• Every decision records the individual user and timestamp.

• Approval rechecks the complete direct-cost basis and protected margin.

Illustrative QA result

Check	Demo status
Serial photo	Complete
Diagnostic answers	Complete
Technician narrative	Complete
Customer signature	Complete
Gross margin check	42.3%

7. Billing and reconciliation

Invoice	Amount	Status
INV-NSM-10482-2	$785	Due in 18 days
INV-NSM-10471-1	$1,240	Paid
INV-NSM-10433-4	$2,835	12 days overdue

• Approved work generates the service report, invoice, technician payout, spreadsheet event, and accounting event as one durable transaction.

• Temporary connector failures remain visible and retryable.

• Payment reconciliation updates A/R, the spreadsheet mirror, and technician statements without retyping the job.

8. Integration choices

Option	Best use	Control
Partner portal	Launch and daily collaboration	Named users; account/location scope
Controlled import	Transitional partner feeds	Validation queue; administrator verification
Account-scoped API	Mature system-to-system exchange	Revocable credentials; idempotency; audit log

Contract configuration defines which services, locations, evidence, pricing, approvals, messages, documents, and integration methods apply to each partner.

9. Security posture

• Individual authenticated identities; no shared passwords.

• Server-side tenant and optional location restrictions.

• HTTPS transport and managed data controls.

• Non-PHI operating boundary using work-order numbers.

• Audit history for access, pricing, status, approvals, and financial events.

10. Recommended controlled pilot

Phase	Action	Evidence of success
Configure	Load contract, rate card, locations, users	Rules reviewed and signed off
Pilot	Process 5-10 work orders	No cross-account exposure; required evidence complete
Measure	Review cycle time, rework, margin, satisfaction	Results based on actual portal records
Expand	Add regions and integration depth	Change-controlled rollout

Suggested meeting decision

Choose one region, one accountable program owner, one service lane, and a small number of real work orders for a controlled implementation.

TechCommand OS is continuously improved through versioned releases. New deployments remain connected to the live domain after each approved release.
